

BRACKETT'S Pad Chiller Field Retrofit for your **Circular Padder:**

As a Circular Padder user, you are already aware of the benefits of having the Brackett Circular Padder in your shop. Now you can expand the capabilities of your machine with this field modification - built by Brackett and in use, industry-wide, our **Pad Chiller**.

The **Pad Chiller** *dramatically* reduces the set-up time for 'slower curing' adhesives. In addition, it solves the problem of lengthy cure-times encountered when gluing thicker pads thus allowing you to maintain the high volume production that you've come to expect from your Brackett Circular Padder.

Our **Pad Chiller** consists of a small refrigeration unit and a custom-made water pan. After each pad passes over the glue roller, it receives a chilled touch of water to rapidly set up the hot-melt glue. The unit can be switched on or off as needed and integrates seamlessly with the operation of your machine. Chiller is pre-set to maintain the water pot at optimum temperature even during heavy, high speed usage. Also included are simple installation/set-up instructions and (as always) the full and friendly support of your Brackett Service Department, just a phone call away.

To add value to an already *invaluable* piece of equipment, click to place an order for our **Pad Chiller** - or call our service / sales department for more information.
