

BRACKETT'S Pad Cooler Field Retrofit **for your Circular Padder:**

As a Circular Padder user, you are already aware of the benefits of having the Brackett Circular Padder in your shop. Now you can expand the capabilities of your CP with this field retrofit - built by Brackett and in use industry-wide.

This addition, which we call our **Pad Cooler** assembly, significantly reduces the set-up time of slower curing adhesives. It can also solve the problem of longer cure times encountered when gluing thicker pads, thus allowing you to maintain the high volume production you've come to expect from your Brackett Circular Padder.

Our **Pad Cooler** consists of a custom-made water pan and pump, designed to mount directly to your Circular Padder. After each pad passes over the glue roller, it receives a cooling touch of water to rapidly set up the hot-melt glue. The unit can be switched on or off as needed and integrates seamlessly with the operation of your machine. The **Pad Cooler** is delivered with the chiller connections capped, should you decide to add a Pad Chiller at a later date. Also included are simple installation/set-up instructions and (as always) the full and friendly support of Brackett's Service Department, just a phone call away.

To add value to an already invaluable piece of equipment, click to place an order for our **Pad Cooler** - or call our service / sales department for more information:
